

A topographic map with contour lines, a red path, and a blue path. The map is overlaid with a dark grey semi-transparent rectangle. The text is white and bold.

Impressions and Lessons Learned From Mesoanalyst Boot Camp

Jesse Lundquist WFO Goodland

Topics

- Structure of Boot Camp
- Key takeaways
- Helpful displays
- Duties of mesoanalyst
- Conclusions

Structure of Boot Camp

- Instruction Days 1-2
- Case work Days 3-4
- Wrap-up/Assessment Day 5

Goal: Accurately anticipate what the radar will look like in 2-3 hours and communicate specifically what/when/where to the public.

Key Takeaways

- Being a mesoanalyst involves having a different mindset
 - Equal in importance to the radar operator
 - Weather safety net for the office
 - Helps the office remain weather ready *not* weather reactive

Key Takeaways

- Maintain mesoscale awareness through an event
 - Don't assume the weather will behave linearly
 - Stay in tune with trends in observations

Key Takeaways

- Environment matters
 - Able to increase lead time for warnings
- Subtle boundaries can drastically change the expected storm behavior if overlooked
 - Differential mixing boundaries
 - Hot vs. warm
 - Moist vs. dry

Key Takeaways

- **Pattern recognition**
 - Not just in the upper air or surface pattern
 - Recognizing patterns in the sounding or hodographs
 - Help anticipate storm behavior
 - Aid in communicating the threats to partners
- **Side note on hodographs**
 - Disservice to yourself to not use them

Key Takeaways

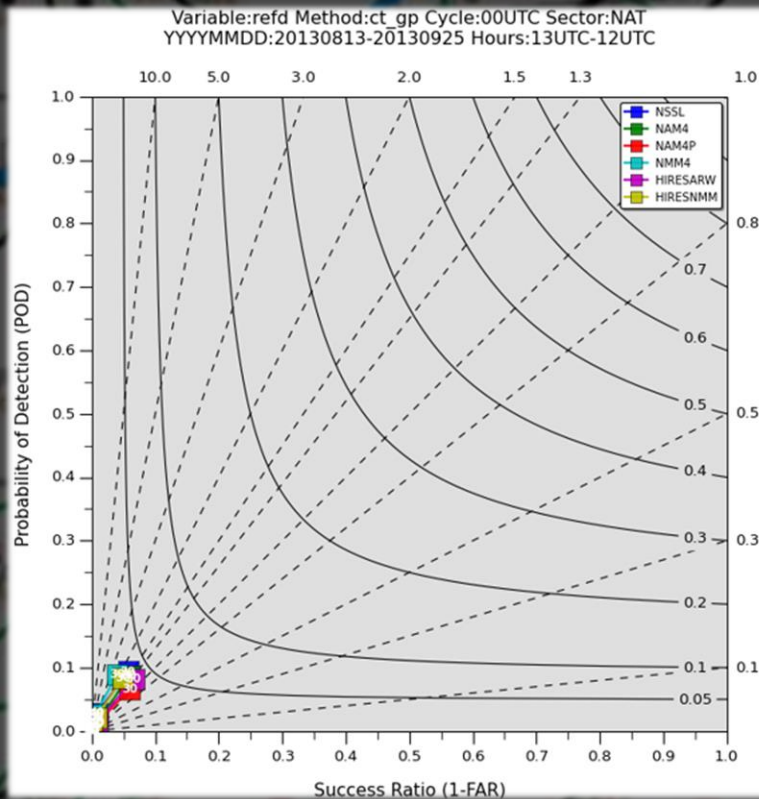

- Which do you have more displays of, radar or satellite data?
 - Indicative of what you are paying more attention to
 - Plethora of information you can glean from satellite data
- Radar
 - Focused on the present
- Satellite
 - Able to anticipate storm behavior
 - Shifts mindset from reacting to storms to being ready
 - Would your mesoanalysis be crippled without it?

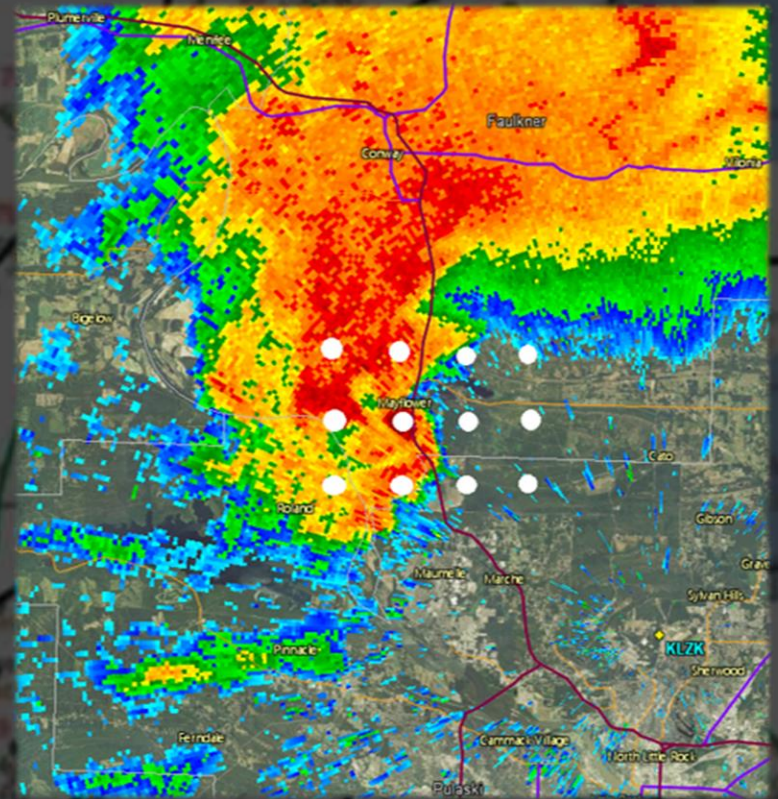

Key Takeaways

- Keeping CAM output in perspective

**National Stats at Grid Point
For 30 dBz or higher
8/13/13 – 9/25/13**

Adapted from Jirak and Thompson

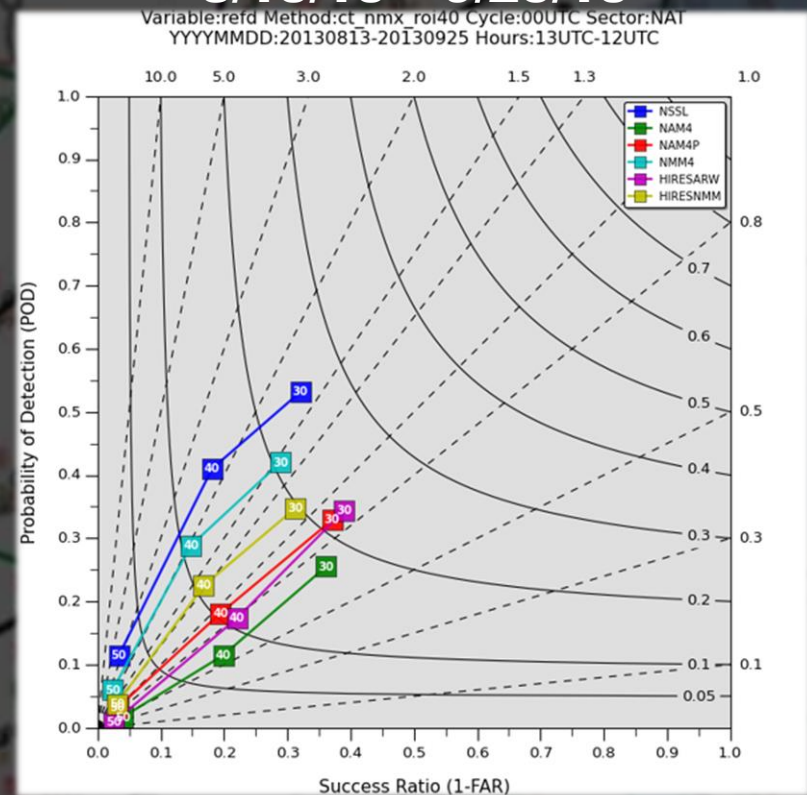

Adapted from Jirak and Thompson

Key Takeaways

- Keeping CAM output in perspective
- Using a neighborhood approach for verification showed increased improvement in CAM verification

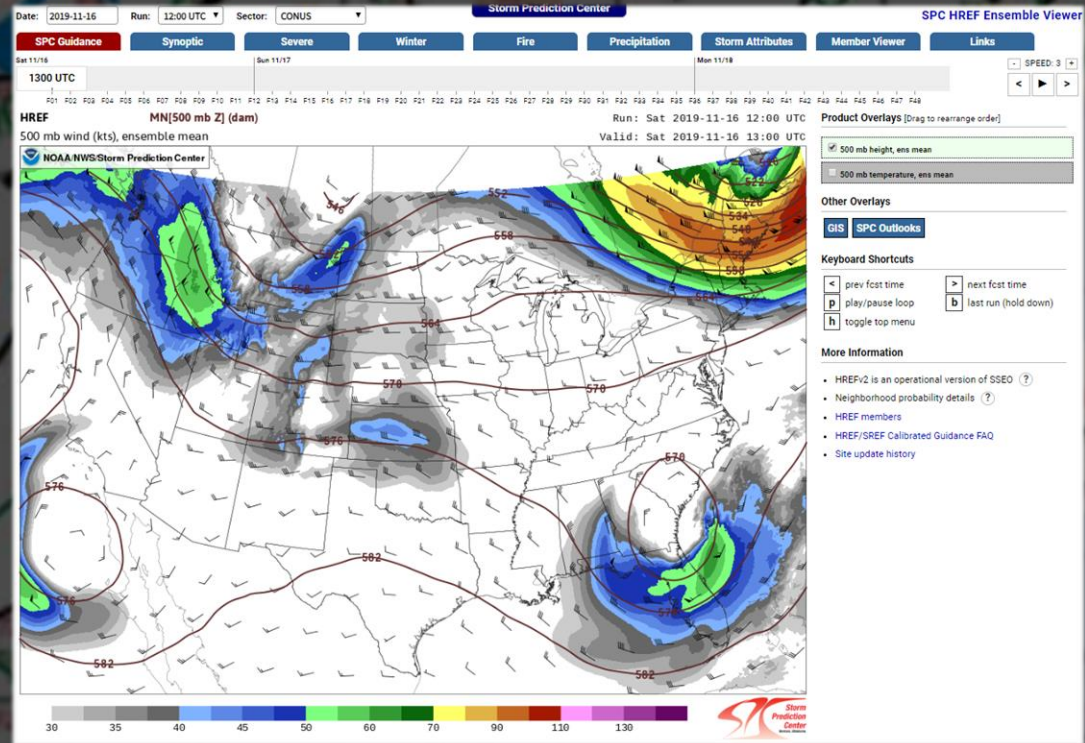

**National Stats 40 KM Neighborhood
For 30 dBz or higher
8/13/13 – 9/25/13**

Adapted from Jirak and Thompson

Side Note on HREF

- One of the best ways to view CAM output.
- The SPC site has probabilities for:
 - QPF
 - Snowfall
 - Blizzard conditions
 - Updraft helicity
 - CAPE
 - Fosberg Index (fire weather)

Side Note on HREF

- The NCEP website has probabilities for:
 - Aviation
 - Severe weather
 - Precipitation type
 - Snow amount

MetEd HREF Information

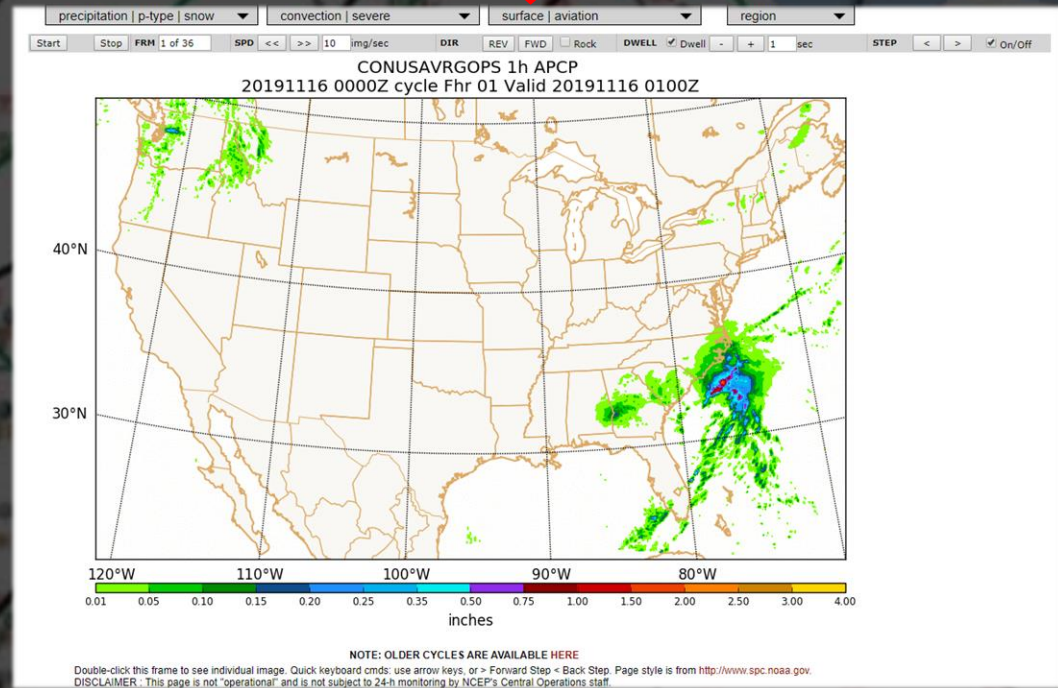

Field Selection

11-17 00:00 UTC

11-18 04:00 UTC

Vis <0.25 mi., wpsd >35 mph in snow, ens prob

Vis <0.5 mi., wpsd >30 mph in snow, ens prob

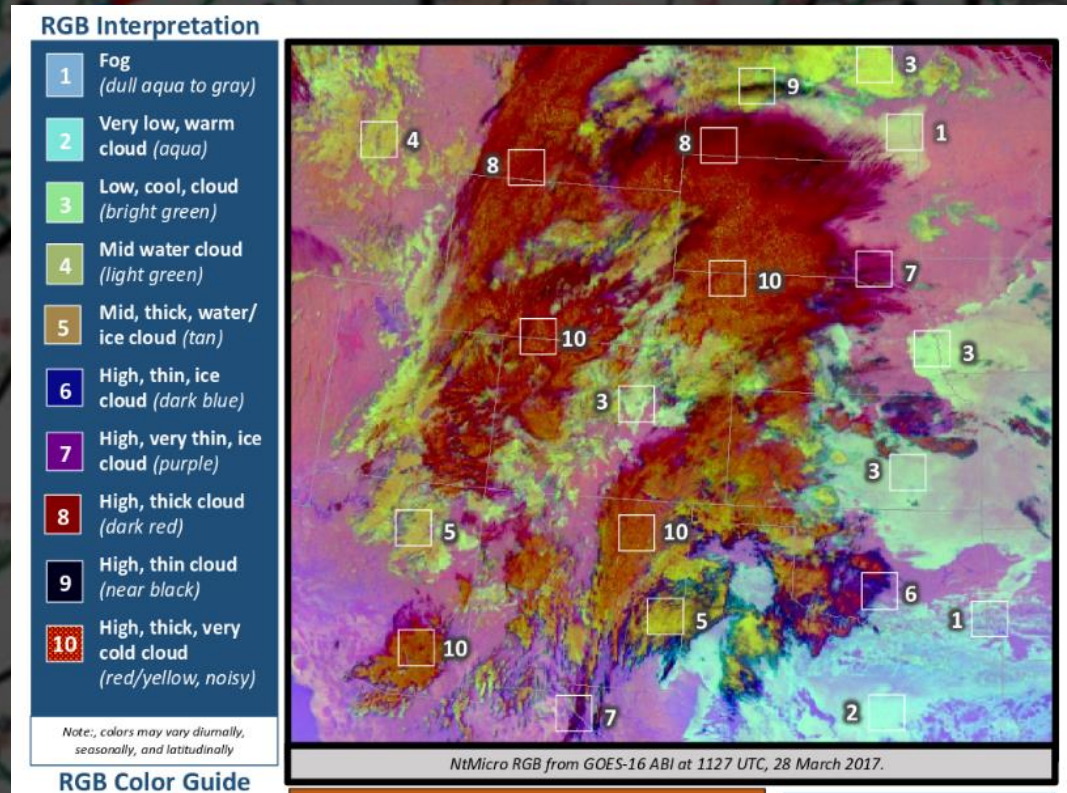

Helpful Displays

- Day cloud phase
 - Distinguish liquid water from ice
 - Under RGB composites
- Daytime cloud phase distinction
 - Evaluate phase of cooling cloud tops
 - Determine growth, decay, glaciation
 - Under RGB composites

Helpful Displays

- **Nighttime Microphysics**
 - Distinguish fog from low, mid, or high clouds
 - Help determine if ice is present in the clouds
 - Under RGB composites

Helpful Displays

- Meso sectors
 - One minute data is crucial
 - Provides a more complete picture

What does a mesoanalyst do?

- Monitors the mesoscale for subtle features
 - Surface observations
 - Satellite data
 - Radar data
 - SPC mesoanalysis data
- Based on data, anticipates what will happen in the next 2-3 hours
- Communicates with radar operator and forecaster

Conclusions

- Weather forecasting is not dead!
- Goal of the mesoanalyst: anticipate what the radar will be showing in 2-3 hours
- Mesoanalyst is the weather safety net
 - Be proactive not reactive
- Leverage satellite data
- Hand analysis helps

Where to go from here

A weather map showing various features such as isobars, isotherms, and fronts. A prominent red line with semi-circles (a cold front) and a blue line with triangles (a warm front) are visible. A dashed black line represents a stationary front. The map includes contour lines for pressure (1000) and temperature (70°). The background is a dark, semi-transparent overlay.

- Practice mesoscale analysis wherever there is hazardous weather.
- Show fellow staff how important mesoscale analysis is.
- Offer mesoscale analysis assistance to offices affected by hazardous weather.

Any Questions?
