# **FMS**

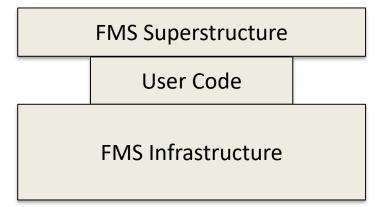

NEMSfv3gfs Forecast System Training and Tutorial 12-14 June, 2018

### What is FMS

Coupler Layer			
Model Component Layer			
Abstraction Layer			
Machine Layer			

Flexible Modeling System effort began in 1998, with GFDL's first distributed memory machine

Superstructure design allows the building of multiple models

Supports multiple dynamical cores, components (ocean, ice, land, etc) and atmospheric physics packages

Infrastructure comprised of common utilities needed by model components

## Infrastructure Layer

FMS Infrastructure

**Abstraction Layer** 

Machine Layer

Two logical layers: machine & abstraction

Machine layer basic interface to parallelism and I/O: MPP

FMS is a high-level functional layer built upon MPP

Abstraction layer contains multiple "managers"

time manager field manager

diagnostic manager tracer manager

block manager fms\_io

and other utilities/APIs:

data override exchange grid

constants astronomy functions

interpolators math functions (ffts, tri-di solver, etc)

### **MPP**

Communication Layer - provides fundamental point-topoint and asynchronous, non-blocking communication

Domains Layer – handles decompositions and tracks which ranks are "connected" for halo updates, I/O, and nesting

I/O Layer - handles all file types including direct interface to NetCDF/HDF

Clocks - allow high-resolution timing of code segments

Miscellaneous - pelists, error handling, reductions, unit tests (functionality and performance), etc

## MPP: pelists

Group of MPI-ranks all working on a specific task

Stored as a sorted, one-dimensional array

Lowest order MPI-rank is considered the "root-pe" 1

All pelists are a subset of the global pelist

Used to create an MPI group and unique communicator

An MPI-rank can belong to multiple pelists

<sup>&</sup>lt;sup>1</sup> Exception: generic gather/scatter routines where root-pe can be "specified"

### **MPP:** Communication

Default is asynchronous and non-blocking: isend, irecv

Synchronization functions based on mpi\_wait to ensure no outstanding messages on an MPI-rank

MPP functions to: send, recv, transmit, bcast, gather, scatter

Defaults to active pelist or specified via optional arg

MPI tags to ensure proper message delivery

Functions based on collectives exist, for performance reasons their use is discouraged (exception *allreduce*)

All datatypes supported: real, integer, character, complex

### MPP: Domains

### Responsible for domain decomposition of:

tiled grids unstructured grids rectilinear grids tri-polar grids

Creates an internal data structure containing:

halo update communication mapping directional data orientation and rotations tile information

Domain data structure is unique to a halo width

Manages nested grid <-> coarse grid boundary updates

### Domain updates via:

pre-defined groups message aggregation asynchronous (start/complete)

Gather decomposed data into a global field array: memory intensive not recommended

### MPP: I/O

#### Abstracts the calls to NetCDF

Provides basic functionality used to build higher level abstraction layer known as *FMS\_io* 

Manages open/close of files and file units

Uses domains logic to create a special I/O domain that can be configured at runtime (see I/O Subset examples)

I/O domain can read from a single file

Automatically includes extra metadata buffer space

Can read "regions" of data to reduce memory bloat

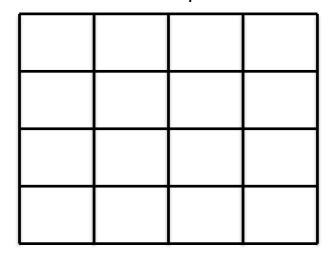

ASCII files can be read by root-pe and broadcast

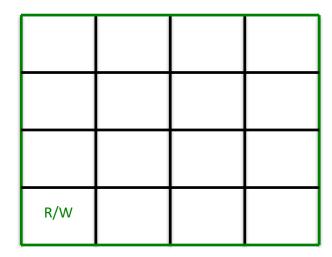

# I/O Subset Example 1

4 x 4 decomposition

1 x 1 io\_subset

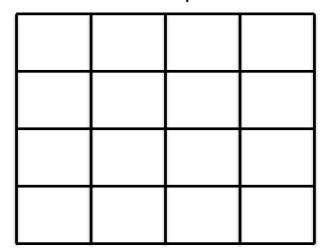

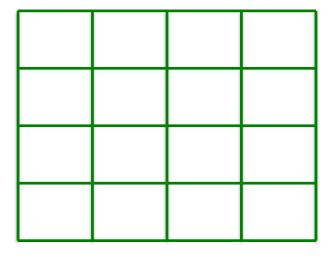

# I/O Subset Example 2

4 x 4 decomposition

4 x 4 io\_subset

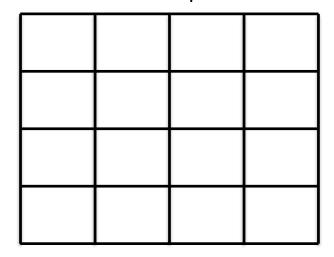

R/W	R/W	R/W	R/W
R/W	R/W	R/W	R/W
R/W	R/W	R/W	R/W
R/W	R/W	R/W	R/W

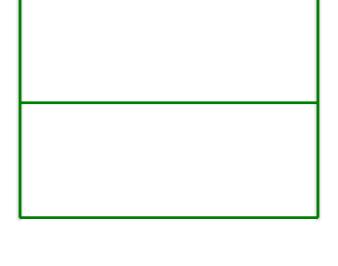

# I/O Subset Example 3

4 x 4 decomposition

1 x 2 io\_subset

R/W		
R/W		

### MPP: Clocks

Uses wtime (default) or system\_clock

Error checks to ensure begin/end pairs are matched

Defined with differing granularities: component, subcomponent, driver, module, routine, loop, infrastructure

Global summary output at end of run: min/max/avg

Per MPI-rank summary available

Verbosity of summary granularity is configurable

Clocks can be "sync'ed" - timer doesn't begin until all members of the pelist have checked in

### MPP: Miscellaneous

### **Error handling**

NOTE message to stdout by root-pe

WARNING NOTE by every member of pelist

FATAL WARNING plus program termination

#### Global sums

#### fast sum

- sum of local sums -> allreduce
- not reproducible across decompositions

#### bitwise exact

- Standard gather to root-pe -> in order sum -> bcast to pelist
- EFP sum convert to int -> mpp\_fast\_sum -> convert to real

#### Checksums

restart integrity checks global, pelist, or local aid in debugging

## FMS\_IO

Most of the IO is mediated through this layer

Wraps the mpp\_io layer to extend basic functionality

### Provides simplified data access

queries, open/close, reads/writes reduces need to fully express metadata for all variables IO subsets and mosaic (tile) transparent to user

### Complete restart functionality

## FMS\_IO

Files expressed in basic format, "tilen" added by MPP layer based on domain information

### Query, Set, and Nullify:

active domain

filename appendix (used for ensembles, nests, etc)

#### Query:

Global and variable attributes field size and name mosaic (tile) number and filename

read/write data using only filename, fieldname, data optionally specify time-level and/or region

### Time Manager

#### Supports multiple calendars

julian no-leap

gregorian no-calendar

30-day months

YY.MM.DD.hh.mm.ss.ticks stored as an abstract type ticks is a configurable fraction of a second (1000 => milliseconds)

Operators to perform "math" on the type

Query and Set the calendar, date, and time

Alarm to alert you when an interval has been reached

Function that returns seconds for a time interval – or optionally days & seconds

## Block Manager

Distributed computing can be abstracted away from scientists and developers - OpenMP requires tight interaction

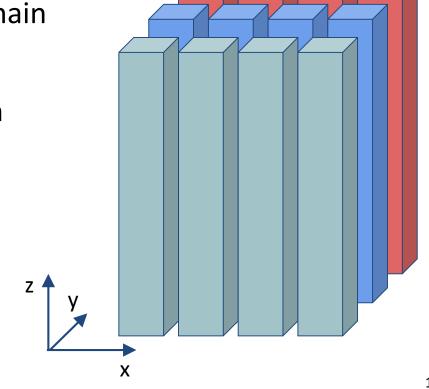

MPI-rank domains are further decomposed to aid with OpenMP threading and populates a type

Stores extent for the MPI-rank domain and for each block

Includes per-block translation from MPI-rank domain to block (indexing)

Blocks expressed in packed (ix,k) or rectilinear (ib,jb,k) format

Blocks are not required to be uniform in size

## Field/Tracer Manager

### Reads in field descriptions from a flat file

Tracks fields by component and classification

#### **APIs** for

initialization of the field from metadata information querying array location mapping from tracer "name" querying generic attributes for specific purposes

#### Tracers can be added mid-run

diagnostic tracers no impact on solution (e.g. particle traces) prognostic tracers may require equilibration or relaxation

# Field/Tracer Manager

```
"TRACER", "atmos_mod", "o3mr"
     "longname", "ozone mixing ratio"
     "units", "kg/kg"
     "profile type", "fixed", "surface value=1.e30" /
"tracer", "atmos_mod", "Extinction"
    "longname", "Extinction for band 4 centered at 1 micron"
    "units", "1/m"
    "tracer type", "diagnostic" /
"tracer_packages","ocean_mod","ocean_age_tracer"
    names = global
    horizontal-advection-scheme = mdfl sweby
    vertical-advection-scheme = mdfl sweby
    restart_file = ocean_age.res.nc
    min_tracer_limit = 0.0 /
```

## Diagnostic Manager

Set of simple calls for parallel diagnostics on distributed systems

Built on the parallel I/O interfaces from FMS\_IO

Capable of multiple sampling and/or averaging intervals specified at run-time

Ouput scalars up to 3D fields

Support for limited-area extents (regional)

Run-time specification of diagnostics controlled through the *diag\_table* file

## Diagnostic Manager

```
fvGFS 20150801.18Z
2015 8 1 18 0 0
# Output files
"grid spec",
                     -1, "months", 1, "days", "time"
                 6, "hours", 1, "days", "time"
"atmos 4xdaily",
"atmos daily", 24, "hours", 1, "days", "time"
"atmos static", -1, "hours", 1, "hours", "time"
# files needed for NGGPS evaluation
"nggps3d 4xdaily", 6, "hours", 1, "days", "time"
                       0, "hours", 1, "hours", "time"

"dynamics", "ps",
                     "SLP",
                                  "atmos daily",
                                                   "all", .true., "none", 2
"dynamics", "ps",
                      "SLP", "atmos 4xdaily", "all", .true., "none", 2
"dynamics", "vort850", "vort850", "atmos 4xdaily", "all", .false., "none", 2
"dynamics", "pt",
                    "temp", "nggps3d 4xdaily", "all", .true.,"236.0, 295.0, -25.0, 49.5,-1,-1",2
"gfs phys", "totprcp", "PRATEsfc", "nggps2d",
                                                "all", .false., "none", 2
```

## Diagnostic Manager

### Similar format to that used by restarts

Multi-entry variables in the *diag\_table* require a single send\_data call, diag\_manager will manage all variations

#### send\_data:

called every timestep (for time averaging and accumulating) alarms used to trigger output<sup>1</sup> optional index arguments for OpenMP/blocked data

<sup>&</sup>lt;sup>1</sup> data sent to NetCDF-managed buffers - actual flush of data controlled separately

### Data Override

### Similar capability to *gcycle* in GFS physics

Using information in the *data\_table*, perform spatial and temporal interpolation to replace a prognostic field

```
# Ice overrides (Old Format)

"ICE", "sic_obs", "SIC", "INPUT/sst_ice_clim.nc", .FALSE., 0.01

"ICE", "sit_obs", "SIC", "INPUT/sst_ice_clim.nc", .FALSE., 1.06

"ICE", "sst_obs", "SST", "INPUT/sst_ice_clim.nc", .FALSE., 1.0

# Atmosphere overrides (New Format)

"ATM", "dust1_aerosol", "dust1", "INPUT/aerosol_month.nc", "none", 1.0

# Land overrides (New Format)

"LND", phot_co2, "co2", "INPUT/co2_data.nc", "bilinear", 1.0e-6
```

#### Overrides done on cyclical basis

```
call data_override ('ATM', 'u_obs', obs, Time, override=done) call data_override ('ATM', 'v_obs', obs, Time, override=done)
```

### FMS: Miscellaneous

### Astronomy:

astronomical variables and properties used mainly by shortwave radiation

### Sat\_vapor\_pres:

initializes the lookup tables given the relative humidity, calculates:

saturation vapor pressure specific humidity vapor mixing ratio

compute derivatives with respect to temperature of:

saturation vapor pressure specific humidity vapor mixing ratio

## Debugging/Troubleshooting

#### Various "restriction" tests

dycore only

physics only – single column mode on full domain

no dycore or physics – tests the framework

zero time run – tests initialization and termination

#### Checksums

find first instance of change in field between two runs

MPP\_EFP\_SUM is\_nan check

FV3: range\_warn=.T. (warning when data outside a given range) fv3\_debug = .T. (copious amounts of output) print\_freq=-1 (max/min/avg)

### Downloading

FMS available on GitHub in the NOAA-GFDL domain:

https://github.com/NOAA-GFDL/FMS

Latest release is warsaw\_201803
