January 1979

USERS GUIDE FOR TDL'S COMPUTER WORDED FORECAST PROGRAM

Mary M. Heffernan and Harry R. Glahn

1. INTRODUCTION

The Techniques Development Laboratory has produced a computer program which generates public weather forecasts in worded form from digital forecasts of weather elements. This computer worded forecast (CWF) program was designed to be implemented concurrently with the AFOS (Automation of Field Operations and Services) system. One version of the program operates at NMC (National Meteorological Center) on NOAA's large computer system and sends forecasts over the NDC (National Distribution Circuit); another version can be run on the local AFOS minicomputer.

It is the main intent of this paper to provide detail on the selection and combination of phrases which compose the forecast. The input to the program, the options available in its use, its operation in the AFOS environment, and future plans will also be discussed. It is hoped that if the forecaster is familiar with these items, the utilization of the program will be simplified and its effectiveness will be increased.

2. INPUT TO PROGRAM

A. Weather Forecasts

The most important inputs to the CWF program are, of course, the weather forecasts. For the version of CWF which operates at NMC, these weather forecasts are produced by the MOS (Model Output Statistics) technique (Glahn and Lowry, 1972). For the version of CWF which can be run locally on the AFOS minicomputer these weather forecasts are local forecasts or a combination of MOS and local forecasts.

Fig. 1 shows the MOS forecasts in matrix form. These forecasts were made from a 0000 GMT model run. The three forecast periods--today, tonight, and tomorrow--covered by the CWF are indicated, as well as a fourth period--tomorrow night, which is given for additional guidance only. The appropriate GMT valid times are also shown.

Note that for most elements the first valid time, 1200 GMT (Z), is 12 hours after the initial data time for the numerical model. The MOS forecasts partially rely, in some cases, on surface observations 3 hours after 0000 GMT. The forecast elements are explained briefly below. It should also be noted that not all elements given are used as input. A CWF generated from this sample matrix is shown in Fig. 2.

GUIDANCE MATRIX	DCA					VALID TIME									
ELEMENT	UNITS	12Z	18Z	00Z	06Z	12Z	18Z	00Z	06Z	12Z

Figure 1. Sample forecast matrix.

DCA FORECAST FOR WASHINGTON, DC
WEDNESDAY 29 NOV 1978
CLOUDY TODAY WITH A SLIGHT CHANCE OF RAIN IN THE AFTERNOON. CHILLY HIGH IN THE MID 50S. LIGHT AND VARIABLE WINDS. TONIGHT--RAIN. LOW IN THE UPPER 30S. LIGHT AND VARIABLE WINDS. THURSDAY--PARTLY CLOUDY WITH A SLIGHT CHANCE OF SHOWERS IN THE MORNING. BREEZY IN THE AFTERNOON. HIGH IN THE MID 50S. PROBABILITY OF PRECIPITATION 20 PERCENT TODAY 80 PERCENT TONIGHT AND 20 PERCENT TOMORROW.

Figure 2. Example of a three-period forecast prepared by the CWF program from the digital data shown in Fig. 1.

TEMP M/M--The max temperature is given for today and tomorrow, and the min for tonight and tomorrow night. Actually, these forecasts each cover a 24-h period (midnight to midnight, local time); therefore, the first max is not for just the daylight hours. (For details, see Klein and Hammons, 1975.)

TEMP--A specific-time temperature forecast is currently available for projections of 9, 12, ..., 48, and 51 hours. These forecasts help determine the wording concerning temperature. Since the MOS forecast max is for a 24-h period and the local forecasts are usually for a 12-h "daytime" period, adjustment of the MOS forecast max is sometimes made to conform with an expected daytime max.

POP(12)--These are forecasts of the probability of occurrence of $\geq$.01 in of precipitation (liquid equivalent) in each of the 12-h periods. Besides determining, in large part, what wording to use regarding precipitation, they are used in the probability statements, rounded to tens of percent. (For details, see Lowry and Glahn, 1976 and NWS, 1977a.)

POP(6)--Forecasts for each of the two 6-h periods within the first three 12-h periods are given. They help determine changes in precipitation occurrence and cloudiness within the 12-h periods.

POF(P)--Forecasts of the probability of frozen precipitation, given that precipitation occurs, are available for seven specific times--every 6 hours starting with 1200 GMT. (For details, see Glahn and Bocchieri, 1975 and Bocchieri and Glahn, 1976.)

POZR(P)--Forecasts of the probability of freezing rain, given that precipitation occurs, are available for seven specific times--every 6 hours starting with 1200 GMT. (For details, see NWS, 1978a.) This element is not used in composing the CWF.

PREC TYP--Freezing, frozen, and liquid (rain or mixed types) precipitation are given by category numbers 1 through 3, respectively, for each of the first three 12-h periods. (See NWS 1978a for details.) This element is not used in composing the CWF.

QPF--Categorical forecasts of quantitative precipitation are given for each of the first three 12-h periods. Categories 1 through 5 indicate <.25, .25-.49, .50-.99, 1.0-1.99, and $\geq$2.0 inches respectively. Threshold probabilities were determined for each category 2 through 5 for transforming probability forecasts into categorical forecasts in such a way that the threat score is maximized. (See Bermowitz and Zurndorfer, 1979 for details.)

SNOW AMOUNT--A categorical forecast of heavy snow is given for the first 12-h period. Categories 0 and 4 indicate <4 and $\geq$ 4 inches, respectively. (See NWS, 1978b for details.) This element is not used in composing the CWF.

R SHR(L), DRZL(L), and RAIN(L)--These are forecasts of the probability of rain showers, drizzle, and nonshowery rain, respectively, given that liquid precipitation occurs. There is one forecast of each variable valid in the

middle of the first three 12-h periods. These are mutually exclusive and exhaustive categories; therefore, except for roundoff, the sum of the three probabilities equals unity. These forecasts are not disseminated by teletype or facsimile; the technique was developed specifically for input to the CWF's. (See Carter, 1974 and 1975a for details.)

TSTM--The unconditional probability of a thunderstorm occurring at the station sometime during the first three 12-h periods is given. Actually, this predictand was determined from 3-hourly observations and will, therefore, be biased toward low values. This is no real problem for use in the CWF's, since a correspondingly low threshold can be used to determine when thunderstorms will be mentioned. The threshold is quite arbitrary and must be determined by experience. Relatively little effort has gone into producing these thunderstorm forecasts. (See Carter, 1974 and 1975a.)

CLOUDS--Clear, scattered, broken, and overcast sky conditions are given by category numbers 1 through 4, respectively, for each of seven projections. Probabilities of each of these categories are objectively determined (Carter and Glahn, 1976) and the categories are specified from these probabilities as described by Carter (1976).

FOG--no forecasts are currently being made for this element.

WIND D/S--Wind direction to tens of degrees and speed are given in the usual convention for each of seven projections. A separate regression equation is evaluated for speed and for the U and V components. Direction is determined from the components and the regression estimate of speed is inflated. (See Carter, 1975b for details.)

CIG--A specific time forecast for six categories of ceiling height is given for the 12-, 18-, 24- and 30-h projections. Categories 1 thru 6 correspond to a ceiling <200, 200-400, 500-900, 1000-2900, 3000-7500, and >7500 ft, respectively. (See NWS, 1978c for details.) This element is not used in composing the CWF.

VIS--A specific time forecast for six categories of visibility is given for 12-, 18-, 24- and 30-h projections. Categories 1 thru 6 correspond to a visibility <1/2, 1/2-7/8, 1-2 1/2, 3-4, 5-6, and >6 mi, respectively. (See NWS, 1978c for details.) This element is not used in composing the CWF.

B. Climatological Maximum and Minimum Temperature

Climatological max and min temperatures are provided for each station. They are used in determining temperature phraseology.

C. Current Observations

Surface observations of temperature and weather are input to assist in the determination of precipitation type.

D. Station Directory

The station directory lists station names and identifying numbers for which forecasts are to be made.

E. Text Phrases

Nearly all words and phrases used in the CWF program are read from data sets rather than being "built in" to the program; this increases flexibility.

F. Text Composition Information

Information is provided concerning the order of phrases, their punctuation, and how they are to be connected to other phrases. A brief explanation is given in Glahn (1978).

G. Control Information

Control information for each of the weather elements included in the CWF--wind, temperature, cloud, and precipitation--is provided. It specifies, among other things, the maximum complexity of wording to be used for each element and forecast period. This information is explained more fully in later sections.

3. CHARACTERISTICS OF FORECASTS

The main goal in developing the CWF program was that the resulting forecasts would be saleable and operationally useful. Therefore, no major departures from the forecast format currently in use by local forecasters were made. Generally, the NWS operational manuals were followed,[1] although these have been under revision during recent years and, for that reason, could not provide absolute guidance.

To achieve the above goal, the program was designed to allow considerable flexibility in choice of phrases. For instance, one station or NWS Region might desire quite detailed forecasts while another might want considerably abbreviated forecasts. Also, different preferences may prevail as to what constitutes "windy," "very cold," etc.

Even with the desire to allow flexibility by a "user" in specifying control parameters, certain guidelines had to be adopted. Three of these are:

- four basic weather elements would be included--wind, temperature, cloud, and precipitation;
- the forecasts would be segmented by period--today, tonight, and tomorrow--except for very simple forecasts in which periods could be easily combined; and

[1] For instance, NWS (1972), NWS (1977b), and NWS (1978d).

- the most important elements would be put near the beginning of the segment.

It was soon found that each basic weather element had to be treated differently from all the rest. For instance, a change (or lack thereof) in temperature from the previous day is many times mentioned, but seldom is a change in wind from the previous day mentioned. Also, wind statements are based almost solely upon the wind vector itself (given at the beginning, middle, and end of each period) while the precipitation statement is based on POP(12), POP(6), POF, R SHR(L), DRZL(L), RAIN(L), TSTM, QPF, TEMP M/M, and CLOUDS (some given once per period, some twice, and some three times).

The following sections describe in some detail how the phrases are selected. Even this description may leave questions that only a detailed flow diagram of the computer program could answer.

4. PHRASE SELECTION

The following sections describe the selection of the four major phrases--wind, temperature, cloud, and precipitation. Appendix I, containing the control constants, and Appendix II, listing all the text phrases, will be helpful references.

A. Wind Phrases

In general, wind phrases are complete sentences into which a speed(s) and/or direction(s) may be inserted. Fig. 3 describes the selection of wind phrases. The phrases are for the first (or today) period. Appropriate changes are made to adapt them to the second or third period. The selection of a wind phrase is dependent upon wind speed and direction, max/min temperature, wind complexity constants, and eleven wind control constants (see Appendix I).

For each period, there are three forecasted wind speeds. There is some overlap between periods. For example, the "end of period" wind speed for the today period (24-h projection) is the "beginning of period" wind speed for the tonight period. The wind values that are used in the selection of wind phrases are designated S1, S2, and S3 for the beginning, middle and end of period wind speed. S1, S2, and S3 are, for the most part, the actual forecasted values from the guidance matrix for that particular period. In some cases, however, it is desirable to filter (smooth) some or all of these wind speeds. Fig. 4 outlines these cases.

As with wind speeds, there are three forecasted wind directions for each period with the same overlap as described in wind speeds. The wind directions that are used in the selection of wind phrases are designated as D1, D2, and D3 for the beginning, middle and end of period wind direction. These are unrounded values, and in most cases it is the differences between wind directions from one part of a period to another that influences the selection of the wind phrase.

Text segment	S1	S2	S3	Other Criteria	Phrase
.	>19	>19	≤19	IW=2; S1>S2	Strong D1 winds S1 mph, diminishing to S3 mph by evening.
4	>19	>19	≤19	IW=2; S2>S1	Strong D2 winds S2 mph, diminishing to S3 mph by evening.
4	>19	≤19	≤19	IW=2	Strong D1 winds S1 mph, diminishing to S3 mph by evening.
1	>19		>19	IW=1; |D1-D3|>60°; |S1-S3|>10 mph	Strong D1 winds S1 mph, becoming D3 S3 mph by evening.
2	>19		>19	IW=1; |D1-D3|>60°; |S1-S3|≤10 mph	Strong D1 winds S1 mph, shifting to D3 by evening.
3	>19		>19	IW=1 or IW=2; |D1-D3|≤60°	Strong D1D3 winds [minimum of (S1, S2, S3)] to [maximum of (S1, S2, S3)] mph.
19	>19		>19	IW=3	Windy.
20	>19		≤19	IW=3	Windy.
4	>19		≤19	IW=1; |D1-D3|≤60°	Strong D1D3 winds S1 mph, diminishing to S3 mph by evening.
5	>19		≤19	IW=1; |D1-D3|>60°	Strong D1 winds S1 mph, shifting to D3 S3 mph by evening.
19	<19	>19	≤19	IW=3	Windy.
8	≤19	>19	≤19	IW=1 or IW=2	Strong D2 winds S2 mph by midday.
6	≤19	≤19	>19	IW=2	Strong D3 winds S3 mph developing by evening.
21	≤19		>19	IW=3	Windy.
9	13-19	≤19	13-19	IW=1 or IW=2; |D1-D3|≤60°	D1D3 winds S1S3 mph.
10	13-19	≤19	13-19	|D1-D3|>60°; TEMP<50°F; J=1 or J=3	Winds S1S3 mph.
10	13-19	≤19	13-19	|D1-D3|>60°; TEMP<40°F; J=2	Winds S1S3 mph
10	13-19	≤19	13-19	IW=3; TEMP≤50°F; J=1 or J=3	Winds S1S3 mph.
10	13-19	≤19	13-19	IW=3; J=2; TEMP<40°F	Winds S1S3 mph.
12	13-19	≤19	≤12	IW=3; J=1 or J=3; TEMP≤50°	Winds S1S2 mph in the morning, diminishing by evening.
12	13-19	≤19	≤12	IW=3; J=2; TEMP<40°F	Winds S1S2 mph in the morning, diminishing by evening.
12	13-19	13-19	≤12	|D1-D2|>60°; TEMP≤50°F; J=1 or J=2	Winds S1S2 mph in the morning, diminishing by evening.
12	13-19	13-19	≤12	|D1-D2|>60°; TEMP≤40°F; J=2	Winds S1S2 mph in the morning, diminishing by evening.
9	13-19	13-19	8-12	IW=1 or IW=2; |D1-D2|≤60°	D1D2 winds S1S2 mph.
11	13-19	13-19	≤7	|D1-D2|≤60°	D1D2 winds S1 to S2 mph in the morning, diminishing by evening.
10	13-19	≤12	8-12	IW=1 or IW=2; |D1-D3|>60°	Winds S3 to S1 mph.
9	13-19	≤12	8-12	IW=1 or IW=2; |D1-D3|≤60°	D1D3 winds S3 to S1 mph
11	13-19	≤12	≤7	IW=1 or IW=2	D1 winds S1 to S2 mph in the morning, diminishing by evening.
7	8-19	>19	>19	IW=1	D1 winds S1 mph becoming strong S2 mph with gusts to __ by evening.
7	8-19	≤19	>19	IW=1	D1 winds S1 mph becoming strong S3 mph with gusts to __ by evening.
9	8-12	≤12	13-19	|D1-D3|≤60°	D1D3 winds S1 to S3 mph.
10	8-12	≤12	13-19	|D1-D3|>60°	Winds S1 to S3 mph.
15	8-12	≤12	8-12	|D1-D2|≤60°; |D1-D3|≤60°; |D2-D3|≤60°	Light D1D3 winds.
16	8-12	≤12	8-12	|D1-D2|>60° or |D1-D3|>60° or |D2-D3|>60°	Light winds.
24	8-12	≤12	8-12	IW=1 or IW=2; |D1-D3|>60°; J=1 or J=3; TEMP≥50°F	Breezy.
24	8-12	≤12	8-12	IW=1 or IW=2; |D1-D3|>60°; J=2; TEMP≥40°	Breezy.
16	8-12	8-12	8-12	IW=3	Light winds.
16	8-12	8-12	≤7	|D1-D2|>60°	Light winds.
15	8-12	8-12	≤7	|D1-D2|≤60°	Light D1D2 winds.
16	8-12	≤7	≤7	|D1-D2|>60°; |D1-D3|>60°	Light winds.
15	8-12	≤7	≤7	|D1-D2|≤60°; |D1-D3|≤60°	Light D1 winds.
13	≤12	13-19	13-19	IW=1 or IW=2; |D2-D3|≤60°	D2D3 winds S2 to S3 mph in the afternoon.
13	≤12	13-19	≤12	|S1-S3|<4 mph; |S3-S1|≥4 mph	D2 winds S2 to S3 mph in the afternoon
11	≤12	13-19	≤12	|S1-S3|≥4 mph	D2 winds S1 to S2 mph in the morning, diminishing by evening.
9	≤12	13-19	≤12	IW=1 or IW=2; |S1-S3|<4 mph; |S3-S1|<4 mph; S1<S3	D2 winds S1 to S2 mph.
9	≤12	13-19	≤12	IW=1 or IW=2; |S1-S3|<4 mph; |S3-S1|<4 mph; S1<S3	D2 winds S3 to S2 mph.
14	≤12	≤19	13-19	|D2-D3|>60°; IW=1 or IW=2; J=1 or J=3; TEMP<50°F	Winds S2 to S3 mph in the afternoon.
14	≤12	≤19	13-19	|D2-D3|>60°; IW=1 or IW=2; J=2; TEMP<40°F	Winds S2 to S3 mph in the afternoon.
6	≤7	≥19	>19	IW=1	Strong D2 winds S2 mph developing by evening.
15	≤7	8-12	8-12	|D2-D3|≤60°	Light D2D3 winds.
16	≤7	8-12	8-12	|D2-D3|>60°	Light winds.
15	≤7	8-12	≤7	|D1-D2|≤60°; |D1-D3|≤60°	Light D1 winds.
16	≤7	8-12	≤7	|D1-D2|>60° or |D2-D3|>60°; IW=1 or IW=2	Light winds.
13	≤7	≤12	13-19		D3 winds S3 mph in the afternoon.
15	≤7	≤7	8-12	|D2-D3|≤60°; |D1-D3|≤60°	Light D3 winds.
17	≤7	≤7	≤7	S1>3 mph or S2>3 mph or S3>3 mph	Light and variable winds.
22	≤3	≤3	≤3		Very light winds.

Figure 3. Wind phrases as a function of the three wind speeds per period--S1, S2, and S3--and the three wind directions per period--D1, D2, and D3. J refers to the forecast period--1, 2, or 3 for today, tonight, and tomorrow, respectively. IW refers to the wind phrase complexity per period--1, 2, or 3 for complex, intermediate, or simple phrases, respectively. A bar over two speeds or directions (e.g., S1S3) indicates an average of those terms.

|S1-S2| < LW2	|S2-S3| < LW2	|S1-S3| < LW2	Smoothing
0	0	0	none
0	0	1	none
0	1	0	average S2 and S3
0	1	1	average S2 and S3
1	0	0	average S1 and S2
1	0	1	average S1 and S2
1	1	0	none
1	1	1	average S1, S2 and S3

Figure 4. Wind Speed Smoothing.
Smoothing is performed in order to keep small changes in forecast wind speeds during a forecast period from unduly influencing phrase selection. S1, S2, and S3 are, respectively, the wind speeds at the beginning, middle, and end of the forecast period. A "1" means the condition specified at the top of the column is satisfied; a "0" means it is not satisfied. LW2 currently has a value of 5 mph.

Some of the simpler wind text statements require no insertions. For example, text statement 24 (see Appendix II) is "Breezy." However, some statements require insertion of a direction and/or a speed(s) or possibly even a range of speeds. All speeds are rounded to the nearest 5 mph. If an average of speeds is to be inserted, the speeds are averaged first and then rounded. When winds are "strong" the word "gusty" is sometimes inserted and a range of speed indicated such that the lower value is the filtered value and the upper value nearly 1 1/2 times that value.[2] Wind directions are converted to the nearest eight points of the compass.

Text statements 9 thru 14 have the option of including a range of speeds. Wind control constant LW10 together with a random number determines if a range of speeds is to be used. LW10 set equal to 100 (0) indicates always (never) to use a range.

(a) If a range is not desired, a range will be used only occasionally and then when the smoothed speeds indicate it.

(b) If a range is desired, the wind control constant LW11 specifies more information.

(1) LW11 = 0 Use range given by unsmoothed speeds. May occasionally be a single value.

(2) LW11 = 1 Use range of 5 or more if unsmoothed speeds specify such. The range is found by adding 5 to the max value of the speeds.

(3) LW11 = 2 The same as 2 above except the range is determined by subtracting 5 from the min of the speeds.

(4) LW11 = 3 The same as 2 and 3 above except the range is determined by adjusting both ends of the speed values.

(5) LW11 = 4 The same as 4 above except use a range of 5 about 60% of the time and a range of 10 about 40% of the time.

(6) LW11 = 5 The same as 4 above except use a range of 10.

B. Temperature

Temperature information is inserted in two parts--a descriptor, such as "unusually cool" or "little change in temperature," and a statement such as "high in the low 90's." The latter, a categorization of the digital temperature forecasts, is always included for each of the three periods, but the descriptor is sometimes omitted.

---

[2]The actual upper value G, before rounding, is computed from the filtered value S and the equation suggested by Tattleman (1975) $G = S(1. + 0.6 \exp(-.011S))$.

Control information for temperature descriptor selection includes a complexity for each period of 1, 2, or 3 and 17 constants LT1, LT2, LT4 through LT17, and LT19. These control constants are explained in Appendix I. Fig. 5 shows all of the max temperature descriptor phrases and how they would be selected as a function of forecast temperature, departure from normal, and change from the day before. The categories are actually determined by the LT constants as shown--the numerical values indicate what these control values are at the present time. This is really a three-dimensional matrix with the third dimension represented by the six phrases in each box corresponding to the key in the lower right corner. The number preceding each phrase is a phrase number, and the three columns of numbers correspond to complexities 1, 2, and 3, respectively. The presence (absence) of a phrase number in a column indicates that the phrase would be used (would not be used) for that complexity. For instance, for a forecast temperature of 70°F, a departure from normal of -8°F, and a change from yesterday of 2°F, "cool" would be used for complexity 1, but no descriptor would be used for complexities 2 and 3. Some combinations have no descriptor defined.

The two-dimensional matrix in Fig. 6 performs the same function for min temperature as the three-dimensional matrix does in Fig. 5 for max temperature. Note that the min temperature phrases and their selection are very simple compared to max temperature.

The digital temperature forecasts are generally presented in four categories--for instance, low 60's (61-63°F), mid 60's (64-66°F), upper 60's (67-69°F), and near 70 (70°F). Departures from this categorization are made for forecasts below 20°F and above 100°F.

Not infrequently, the 3-hourly temperature forecasts indicate the max will not occur in the afternoon. For instance, a warming trend may be indicated by a higher forecast temperature at a projection of 27 or 30 hours than at any other time. Or, a cold frontal passage may be indicated by a higher forecast temperature at 0900 or 1200 GMT than at any later time. Nine different temperature "traces" have been identified. The definitions of these traces and wording that is chosen based on these traces are given in Fig. 7.

C. Cloud Phrases

The selection of cloud phrases is dependent upon the forecast cloud amount at the beginning, middle, and end of the period; the cloud phrase complexity constants; and the period itself. For the cloud amounts, there is some overlap between periods. For example, the "end of period" cloud amount for today (24-h projection) is the "beginning of period" cloud amount for tonight. Cloud amounts are forecast in categories. Categories one through four correspond to clear, scattered, broken, and overcast, respectively. The cloud phrase complexity constants range in value from one through three, where one specifies the most complex wording and three the simplest. Appendix III describes the selection of the cloud phrases and the consistency checks that are made from period to period.

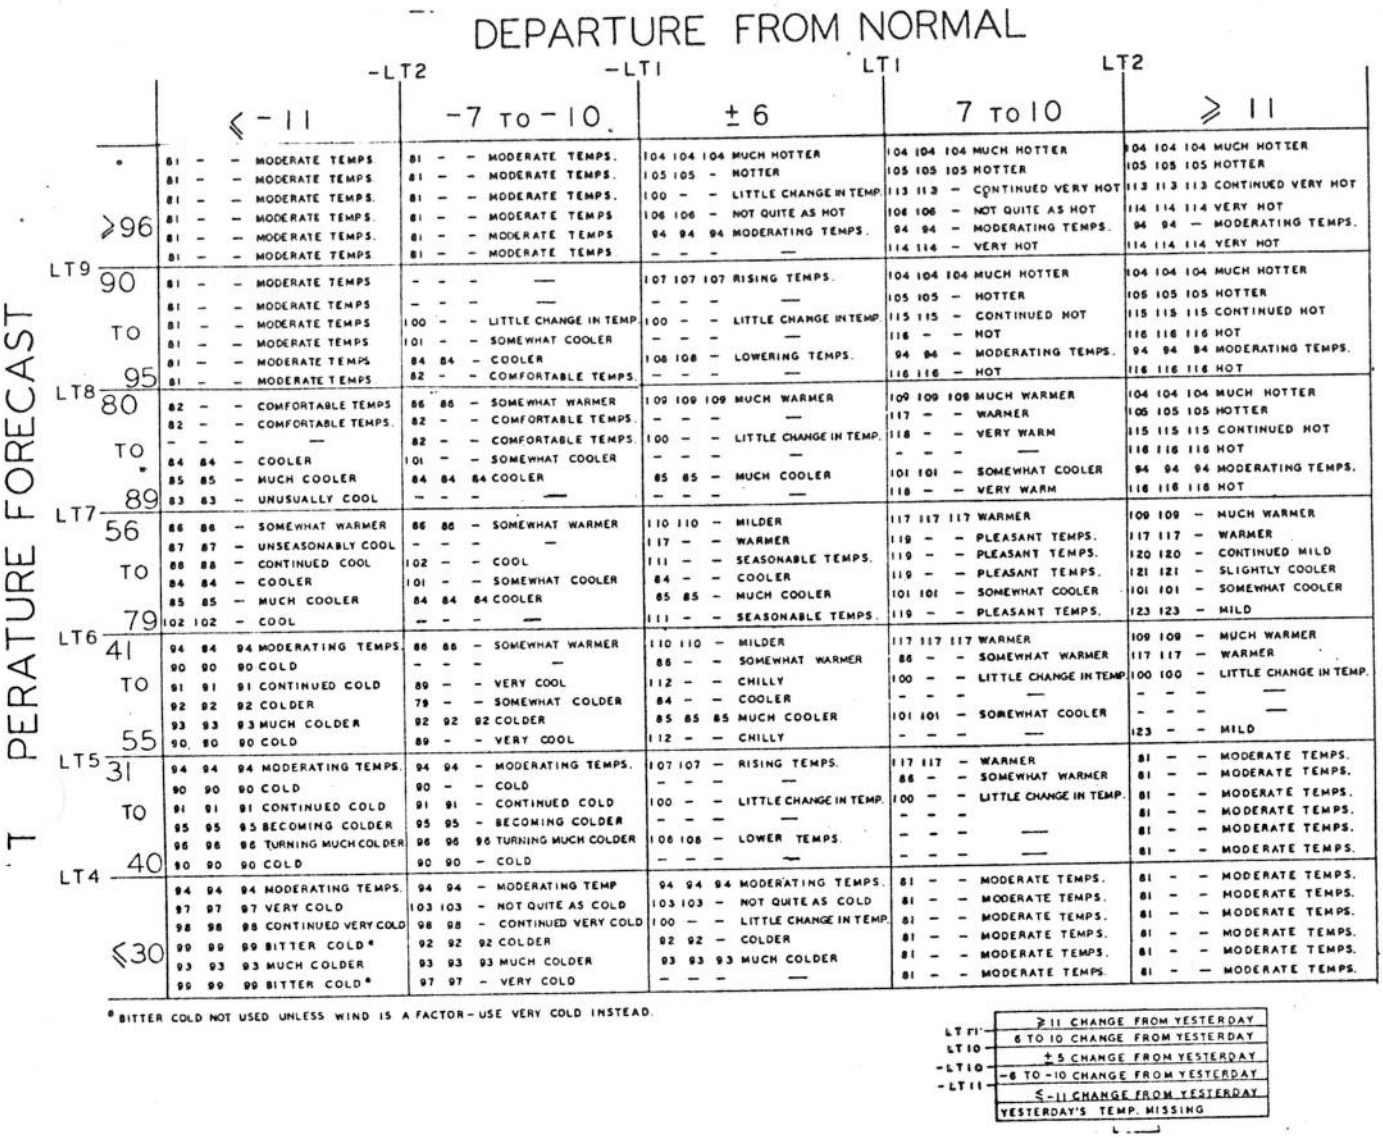

Figure 5. Maximum temperature descriptors indicated as a function of forecast temperature, departure from normal, and change from the day before. All temperatures are in °F.

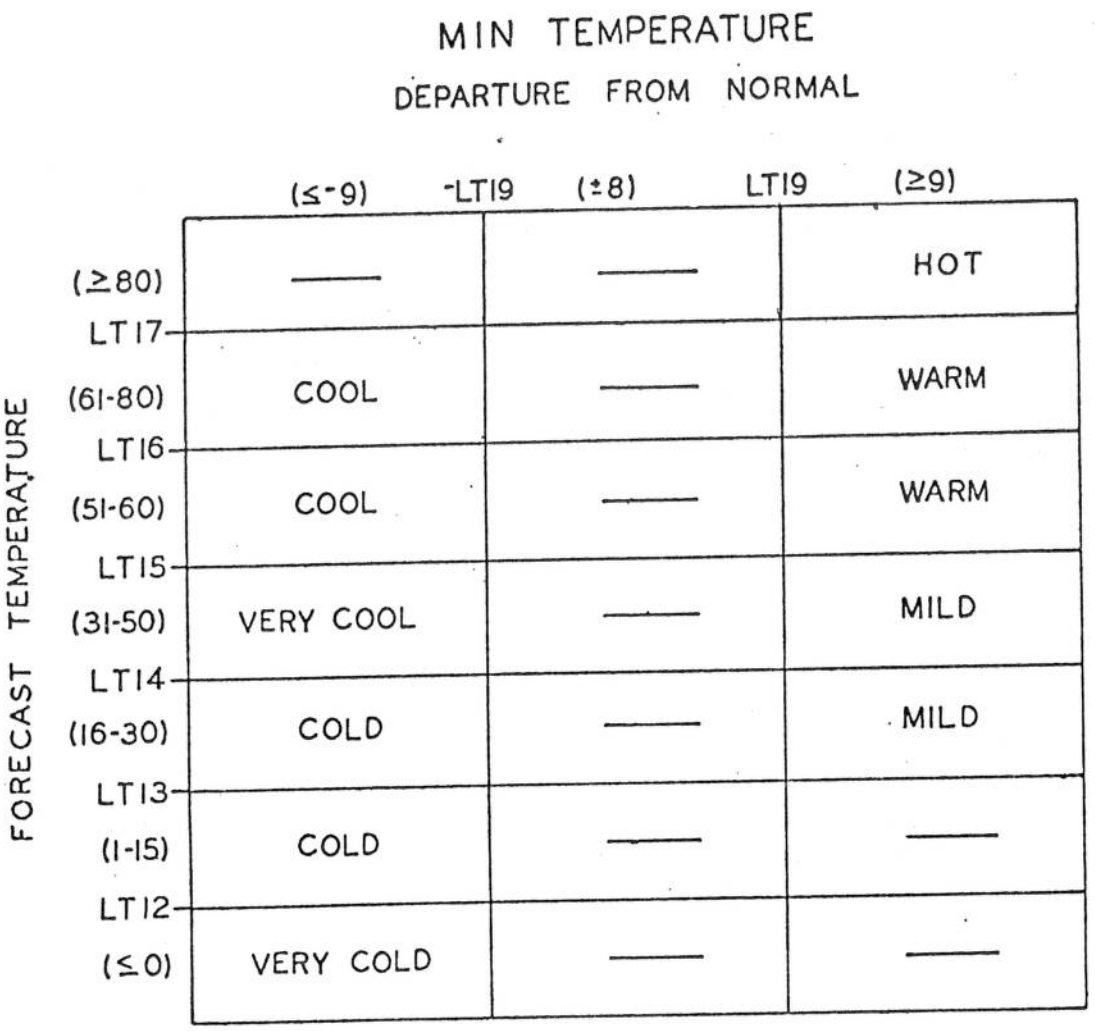

Figure 6. Minimum temperature descriptors indicated as a function of forecast temperature and departure from normal.

T.	Max 3 Hourly Temperature	Other Criteria	Temperature Value in Phrase	Phrase
1	27 or 30Z (30Z central and pacific)	--	the lesser of (- max of 3 Hourly at 15, 18, 21 or 24Z (18, 21, 24, or 27Z pacific) plus 3 degrees or - 24 hour max)	"Daytime high ..."
2	12Z (15Z pacific)	Var* ≥ 5.0	3 hourly temp at 12Z (15Z pacific)	"Early morning high ... "
3	12Z (15Z pacific)	Var* ≥ 5.0 3 Hourly 12Z-3 Hourly 21Z (15 and 24Z pacific) ≥ 8 degrees	3 hourly temp at 12Z (15Z pacific)	"Early morning high ..., becoming cooler during the day."**
4	12Z (15Z pacific)	Var* ≥ 5.0 3 Hourly 12Z-3 Hourly 21Z (15 and 24Z pacific) ≥ 15 degrees	3 hourly temp at 12Z (15Z pacific)	"Early morning high ... , becoming much cooler during the day."**
5	15Z (18Z pacific)	Var* ≥ 5.0	3 hourly temp at 15Z (18Z pacific) plus 2 degrees	"Morning high ... "
6	15Z (18Z pacific)	Var* ≥ 5.0 3 Hourly 15Z-3 Hourly 21Z (18 and 24Z pacific) ≥ 8 degrees	3 hourly temp at 15Z (18Z pacific) plus 2 degrees	"Morning high ... , turning cooler in the afternoon."**
7	15Z (18Z pacific)	Var* ≥ 5.0 3 Hourly 15Z-3 Hourly 21Z (18 and 24Z pacific) ≥ 15 degrees	3 hourly temp at 15Z (18Z pacific) plus 2 degrees	"Morning high ... , turning much cooler in the afternoon."**
8	18, 21 or 24Z (21, 24 or 27Z pacific)	24 hr max-3 Hourly at 24Z (27Z pacific) ≥ 10 degrees and wind shift from beginning to end of period ≥ 60° and the wind direction at end ≥ 270° and todays 24 Hour max-tomorrows 24 Hour max ≥ 8° or today's 24 Hour max-tomorrows 24 hour max ≥ 15 degrees and Var* ≥ 5.0	24 hour max	"..., turning cooler in the late afternoon."**
9	18, 21 or 24Z (21, 24 or 27Z pacific)	as 8 above except the difference of the 24 hour max and the 3 Hourly at 24Z (27Z pacific) ≥ 17 degrees	24 hour max	"..., turning much cooler in the late afternoon."**

Figure 7. 3-hourly temperature traces.
*Var - variance of the first eight (9Z-30Z) 3-hourly temperatures.
**If the 3-hourly temp at 24Z Pacific) is less than LT6 (56), "cooler" is changed to "colder."

D. Precipitation Phrases

Phrase selection for precipitation is more complicated than for the other three elements. It depends on 10 of the 18 variables appearing in the forecast matrix in Fig. 1.

Precipitation phrases can have three parts. One is a qualifier; if it is "chance of" for instance, it will be first; if it is "likely," it will be second. Another part, which can also be first or second, is the precip descriptor, such as "snow" or "showers." The third part, if there is one, is always a time definition such as "in the morning." Besides these basic two-or-three-part phrases, there are also lengthy phrases describing intraperiod changes which are complete within themselves except that the qualifier must be inserted. An example with the qualifier "likely" inserted, is "snow likely in the afternoon turning to rain before evening."

Control information for precip phrase selection includes a complexity for each period of 1, 2, or 3 and 23 control constants, LP1 through LP23. These constants are explained in Appendix I. The selection of precip phrase parts is discussed in the following sections. A number in parentheses following the precip phrase is the phrase number. These numbers correspond to the phrase numbers in Appendix II. The number in parentheses following a constant is the present value of that constant. It should be noted that no precip phrase will be used if 1) the 12-h POP is less than 10 percent or 2) if the 12-h POP is less than LP1(20) and the TSTM is less than LP5(10).

Fig. 8 shows the flow for the selection and combination of precip phrase parts. The different steps in this process are discussed in the following paragraphs.

a. Fig. 9 shows the criteria for determining the appropriate precipitation qualifier. Basically the qualifier is dependent upon the 12-h PoP for the period.

b. The precip descriptor is dependent upon the POF at the beginning, middle, and end of the period; the forecasted max/min temperature; and the forecasted precip for the period. The definitions of these categories are given in Figs. 10, 11, and 12 for POF, temperature, and precip, respectively.

c. Based on the categories determined in b above, the code or phrase number is located in the precip matrices in Fig. 13. Each of these matrices is really three-dimensional matrix with the third dimension represented by the three rows of numbers in each box corresponding to the key in the lower right corner. Numbers greater than 8 are phrase numbers (see Appendix II) and numbers 1 thru 8 are codes which are described in Fig. 14. The three columns of numbers in Fig. 13 correspond to the first, second, and third period, respectively. For instance, if precip was indicated for all of the period, the temperature was in the low range, and if the POF categories were determined to be high, middle, and low for the beginning, middle, and

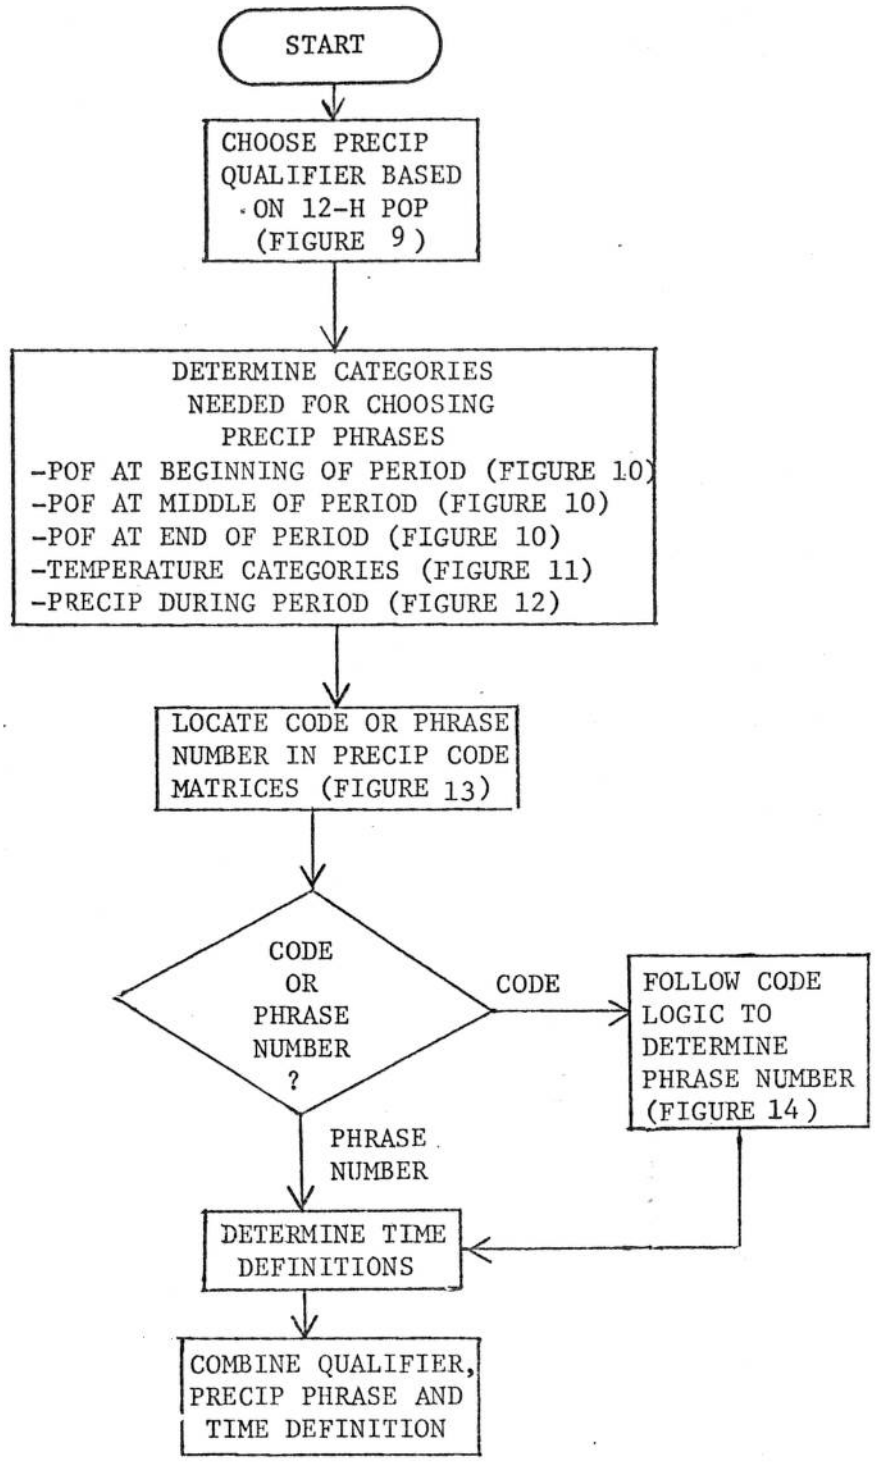

Figure 8. Flow diragram for the selection and combination of precipitation phrase parts.

Criteria	Qualifier
LP1(20) > 12-h POP $\geq$ 10% and TSTM $\geq$ LP5(10)	"slight chance of" (#140)
LP2(25) > 12-h POP $\geq$ LP1(20)	"slight chance of" (#140)
LP3(55) > 12-h POP $\geq$ LP2(25)	"chance of" (#142)
LP4(75) > 12-h POP $\geq$ LP3(55)	"likely" (#143)
12-h POP $\geq$ LP4(75)	no qualifier used

Figure 9. Precipitation qualifiers.

High	POF > LP7(65)
Middle	LP7(65) $\geq$ POF $\geq$ LP9(35)
Low	LP9(35) > POF

Figure 10. POF ranges.

Low	J=1, P = Beg, $TEMP_c$ < LP12(27)
Low	J=1, P $\neq$ Beg, TEMP < LP15(34)
Low	J=3, TEMP < LP14 (34)
High	If none of the above conditions are satisfied.

Figure 11. Temperature categories (TC) are defined by the portion of period in which precip is specified (P) (see Fig. 12), the current temperature ($TEMP_c$), the max/min temperature (TEMP), and the forecast period (J).

rtion of Period	Criteria
Beginning	6-h POP_2< LP17(10); (6-h POP_1-6-h POP_2) >LP18(25)
Beginning	6-h $POP_1 \geq$12% or 6-h $POP_2 \geq$ 12%; 6-h $POP_2 \leq$ 1/2 6-h POP_1; 6-h $POP_2 \leq$ 1/2 12-h POP; $C_1 \geq 3$; $C_1 > C_3$
Beginning	6-h $POP_1 \geq$ 12% or 6-h $POP_2 \geq$12%; J=1; 6-h POP_2 <20%; (6-h POP_1 - 6-h POP_2) > LP18(25); 12-h POP_1 > 12-h POP_2
Beginning	6-h $POP_1 \geq$ 12% or 6-h $POP_2 \geq$ 12%; 6-h $POP_2 \leq$ 1/3 12-h POP; 6-h $POP_2 \leq$ 1/3 6-h POP_1; $C_1 > C_3$
Beginning	6-h $POP_1 \geq$ 12% or 6-h $POP_2 \geq$ 12%; J=2; 6-h POP_2 < 20%; (6-h POP_1 -6-h POP_2) > LP18(25); 12-h POP_1 > 12-h POP_2; 12-h POP_2 > 12-h POP_3
Beginning	6-h $POP_1 \geq$ 12% or 6-h $POP_2 \geq$12%; J=3; 6-h POP_2 < 20% (6-h POP_1 - 6-h POP_2) > LP18(25); 12-h POP_2 > 12-h POP_3
Beginning	6-h $POP_1 \geq$ 12% or 6-h $POP_2 \geq$ 12%; cloud phrase is "clearing" (#51); 6-h POP_2 = (6-h POP_1 - 5%); 6-h POP_2 < 25
End	6-h POP_1 <LP17(10); (6-h POP_2 - 6-h POP_1) >LP18(25)
End	6-h $POP_1 \geq$ 12% or 6-h $POP_2 \geq$ 12%; 6-h $POP_1 \leq$ 1/2 12-h POP; 6-h $POP_1 \leq$ 1/2 6-h POP_2; $C_3 \geq 3$; $C_3 > C_1$
End	6-h $POP_1 \geq$ 12% or 6-h POP_2 _>12%; 6-h $POP_1 \leq$ 1/3 12-h POP; 6-h $POP_1 \leq$ 1/3 12-h POP_2; $C_3 > C_1$
End	6-h $POP_1 \geq$ 12% or 6-h $POP_2 \geq$ 12%; J=1; 6-h POP_1 <20% (6-h POP_2 - 6-h POP_1) > LP18(25); 12-h POP_2 > 12-h POP_1
End	6-h $POP_1 \geq$ 12% or 6-h $POP_2 \geq$ 12%; J=2; 6-h POP_1 <20% (6-h POP_2 - 6-h POP_1) > LP18(25); 12-h POP_3 > 12-H POP_2; 12-h POP_2 > 12-h POP_1
End	6-h $POP_1 \geq$ 12% or 6-h $POP_2 \geq$ 12%; J=3; 6-h POP_1 <20%; (6-h POP_2 - 6-h POP_1) > LP18(25); 12-h POP_3 > 12-h POP_2

Figure 12. The portion of the period in which precipitation is specified (P). If none of the above sets of criteria to place the precip at the beginning or end of the period is met, it is assumed to be all the period. C1, C2, and C3 refer to the forecast cloud amount at the beginning, middle, and end of period, respectively. J refers to the forecast period--1, 2, or 3 for today, tonight or tomorrow, respectively. 6-h POP_1 and 6-h POP_2 refer to the first and second 6-h POP of the period respectively. 12-h POP_1, 12-h POP_2, 12-h POP_3 refer to the 12-h POP for the first, second, and third period, respectively.

Precipitation indicated at beginning of period.

Figure 13. Precipitation codes (numbers 1 through 8) or phrase numbers given for the first, second, and third period, respectively.

Code Number	Criteria	Phrase
1	$\overline{POF_p}$ < LP6 (50)	"wet snow" (#145)
	J=1; P≠END; CW=L	"wet snow" (#145)
	if the above criteria are not met	"snow" (#144)
2	TC=HIGH	"snow, sleet, or freezing rain" (#150)
	TC=LOW; POF_p < LP8 (50)	"rain or rain mixed with snow" (#149) or "rain or rain and snow mixed" (#148)
	TC=LOW; $POF_p \geq$ LP8 (50)	"snow or snow mixed with rain" (#147) or "snow or snow and rain mixed" (#146)
3	J=1; P=END; CW=L	"sleet or freezing rain" (#212)
	J=1; P≠END; CW=L; DRZL> R SHR; DRZL ≥ RAIN; DRZL ≥ LP10 (40); 12-h $\overline{POP} \geq$ LP10 (40)	"drizzle" (#151
	J=1; P≠END; CW=L; DRZL< R SHR; DRZL<RAIN; DRZL<LP10 (40); R SHR < RAIN; 12-h POP < LP10 (40); and if TSTM > LP16 (10)	"rain" (#153) "rain and thunderstorms" (#158)
	J=1; P≠END; CW=L; DRZL < R SHR; DRZL < RAIN; DRZL < LP10 (40); 12-h POP < LP10; R SHR > RAIN; and if TSTM > LP16 (10)	"showers" (#152) "showers and thunderstorms" (#157)
4	DRZL ≥ RAIN; DRZL > R SHR; DRZL ≥ LP10 (40); 12-h POP ≥ LP10 (40)	"drizzle" (#151)
	RAIN ≥ R SHR and if TSTM > LP16 (10)	"rain" (#153) "rain and thunderstorms" (#158)
	R SHR > RAIN and if TSTM > LP16 (10)	"showers" (#152) "showers and thunderstorms" (#157)
5	J=1; P≠END; CW=S or R and S	"wet snow" (#145)
	if the above criteria are not met	"rain turning to snow" (#206)
6	J=1; P=END; CW=ZR	"sleet or freezing rain" (#212)
	J=1; P≠END; CW=L	use the logic under code 4
	if the above criteria are not met	"snow changing to sleet or freezing rain" (#210)
7	J=1; P≠END; CW=L	use the logic under code 4
	if the above criteria are not met	"snow changing to rain" (#211)
8	J=1; P≠END; CW=S or R and S	use the logic under code 1
	if the above criteria are not met	"sleet or freezing rain turning to snow" (#207)

Figure 14. Description of precipitation codes. J refers to forecast period--1, 2, or 3 for today, tonight, or tomorrow, respectively. P refers to the portion of the period in which precip is indicated--beginning, all, or end. CW refers to the weather field from the hourly observation--L, S, S and R, and ZR for liquid, snow, snow and rain mixed, and freezing rain respectively. $\overline{POF_p}$ refers to the average of the POF's for the portion of the period in which precip is specified. For example, if the precip is indicated at the end of the period (P=END) then POF_p would be the average of the second and third POF's for the period. TC refers to the temperature category (see Fig. 11).

end of period, respectively, the phrase numbers would be 192, 302, and 219 for the first, second, and third period, respectively. Locating these phrase numbers in Appendix II, the phrases are as follows.

First Period

"Snow ... today ... changing to sleet or freezing rain during the afternoon." (#192)

Second Period

"Snow ... turning to sleet or freezing rain after midnight." (#302)

Third Period

"Snow ... turning to sleet or freezing rain during the afternoon." (#219)

d. The selection of the precip descriptor based on the precip codes 1 thru 8 is described in Fig. 14.

e. Time definition for precip phrases depends upon the period and the portion of the period in which precip is expected to occur. The appropriate phrases are chosen from the list below. If the precip phrase complexity for the period is 3, no time definition will be used.

"in the afternoon" (#159)
"in the morning" (#160)
"after midnight" (#161)
"before midnight" (#162)

f. In the more complex precip phrases, only the qualifier needs to be inserted, since intraperiod changes are included. For the basic two or three part phrases, the combination of the qualifier, descriptor, and time definition is determined by the type of phrase.

5. THE FORECASTER AND CWF IN AFOS

For nearly 10 years, the Techniques Development Laboratory has been experimenting with producing public weather forecasts in worded form by computer. These computer worded forecasts have been available to some WSFO's (Weather Service Forecast Offices) for a limited number of stations via the KCRT system for the past several years. However, the AFOS system with adequate computer, display, and communications capability, allows the full implementation of the CWF.

In the AFOS network, each WSFO will receive a CWF and a digital guidance matrix (Fig. 1) for each station in its area of responsibility for which MOS forecasts are made. These products will be produced centrally on the IBM

360/195 at NMC. They will be sent via the NDC and will be available to the public forecaster before the issue time of the early morning forecast.

When MOS forecasts are not available for a particular station and for zones, interpolation will be made from two to four stations for which MOS forecasts are available. Both a CWF and the digital forecast matrix will be transmitted.

A version of the CWF program will also be available for use on the local minicomputer. This will allow four options for the use (or nonuse) of the CWF at the WSFO:

a. Complete Acceptance

If the forecaster is satisfied with both the wording and the digital values in the CWF, he can disseminate the CWF with little more than the push of a button.

b. Minor Revision

If the forecaster wants to make minor changes to the wording or numerical values, that can be done with the text-editing capability of the AFOS equipment.

c. Major Revision

If the forecaster wants to make considerable revision of the digital forecasts, he can do so on the AFOS KCRT and then initiate the CWF program on the local mini. Wording will then be generated which conforms to the amended digital forecast. Options a, b, and d are then available for this locally-produced CWF.

d. Total Disregard

This option is always open.

The CWF application may be tailored to a station's needs or desires by adjustment of both the control constants and the phrase complexity constants for each weather element. For example, one station may want to define a temperature below 10°F as "very cold" while another would not consider a temperature as "very cold" unless it were below 5°F. Adjustment of the temperature control constants would allow this flexibility. Changes such as these would not be made frequently. It is planned that initially each station would receive the assigned values for these constants listed in Appendix I. After a period of time using the CWF program, an update of these constants would be made for all stations desiring it. After the initial update, subsequent updates would be made as needed. All updates would be handled centrally at NWS Headquarters.

In addition to modifying these constants in this manner, the phrase complexity constants may be modified at run time on the AFOS minicomputer. These modifications would apply only to that particular run. (For further detail see NWS, 1978e.)

6. PLANS FOR THE FUTURE

It may turn out, as AFOS implementation nears completion, that all CWF's should be produced on the local minicomputer rather than be sent over the NDC. This option would trade circuit loading for minicomputer time and can be exercised any time it seems appropriate.

The present program does not combine periods when the forecast conditions are much the same for two or more of the periods. This feature will be added at a later date. In addition, terminology dealing with "watch" situations, blizzards and winter storms, and snowfall depths will be added.

The present program produces forecasts for the today, tonight, and tomorrow periods in that order. After we get the initial reaction from field forecasters using it in the AFOS environment and make any necessary modifications, we will write the software to produce CWF's for the tonight, tomorrow, and tomorrow night periods for use in the late afternoon and early evening. Another extension of the effort will be to produce "updates" that can be issued in the late morning and late evening.

7. ACKNOWLEDGMENTS

The work of many people in the Techniques Development Laboratory has made the production of a CWF possible; some, but not all, are included in the references. We would like to thank each of these dedicated people. We especially thank Mercedes Bakon for typing this manuscript and Thomas Bethem for programming support. We also wish to acknowledge the helpful suggestions of Larry Hughes, Fred Zuckerberg, Paul Moore, and Leonard Snellman of the NWS Regional Offices, William Klein of the Systems Development Office, Dale Lowry of TDL, and Steve Harned and Duane Cooley of the Office of Meteorology and Oceanography.

Tattleman, P., 1975: Surface gustiness and wind speed range as a function of time interval and mean wind speed. J. of Appl. Meteor., 14, 1271-1276.

Appendix I
Phrase Control Constants

Wind Control Constants

Constant	Value	Description
LW1	10	If a random number is less than LW1, wind direction without "erly" is used.
LW2	5	If certain speeds are within LW2 of each other they are averaged. See Fig. 4.
LW3	2	If all 3 winds in a period are less than or equal to LW3, the phrase will be "very light winds."
LW4	7	If wind speed is greater than LW4 and less than or equal to LW5, it is in the "light" category but the wind direction may still be mentioned. If the wind speed is less than or equal to LW4, the direction is not mentioned.
LW5	12	If the wind speed is greater than LW5 and less than or equal to LW6, it is in the middle range.
LW6	19	If the wind speed is greater than LW6, it is designated strong or windy.
LW7	60	If the wind direction difference is less than or equal to LW7, only one wind direction is mentioned.
LW8	10	If the wind speed difference is less than or equal to LW8, only one wind speed is mentioned. This is used only for strong winds.
LW9	50	If the forecasted max temperature (today and tomorrow periods) is less than LW9 "Breezy" is not used. If the forecasted min temperature (tonight period) is less than LW9-10 "breezy" is not used.
LW10	100	If LW10 is greater than or equal to a random number, a range of wind speeds is used in text statements 9-14. To always use a range specify LW10 greater than or equal to 100. To never use a range specify LW10 equal to zero.
LW11	0	If a range is desired (see LW10) then 0 - speed range indicated by unsmoothed forecasts 1 - speed range of 5, by increasing max 2 - speed range of 5, by decreasing min 3 - speed range of 5, by changing both max and min 4 - speed range of 5 or 10, about evenly divided, by changing both max and min.

Unsmoothed and unrounded speeds are used for setting range.

IW	1	Complexity value for the today period.
	2	Complexity value for tonight period.
	3	Complexity value for tomorrow period.

Temperature Control Constants

Constant	Value	Description
LT1	6	If the max temperature is within LT1 degrees of normal, the temperature is deemed "normal."
LT2	10	If the max temperature is within LT2 but greater than LT1 degrees of normal, the temperature is unusual but not extreme. If is is greater than LT2, it is extreme.
LT3	15	Wind chill will be considered if it is LT3 degrees below max or min temperature.
LT4	21	Define seven categories of max temperature.
LT5	41	
LT6	56	
LT7	80	
LT8	90	
LT9	96	
LT10	5	If the change of max temperature from yesterday is within LT10 degrees, it is not unusual.
LT11	10	If the change of max temperature from yesterday is within LT11 degrees but greater than LT10 degrees, it is unusual but not extreme. If it is greater than LT11, it is extreme.
LT12	1	Define seven categories of min temperature.
LT13	16	
LT14	31	
LT15	51	
LT16	61	
LT17	80	
LT18	-	Not used
LT19	8	If the min temperature is within LT19 degrees of normal, it is not unusual.
IT	1	Complexity value for today period.
	2	Complexity value for tonight period.
	2	Complexity value for tomorrow period.

Cloud Control Constants

Constant	Value	Description
LC1	0	If a random number is greater than or equal to LC1, "overcast" will be used as originally specified; otherwise, "cloudy" will be substituted. To never use "overcast" set LC1 equal to 100. To always use "overcast," set LC1 equal to 0.
IC	1	Complexity value for today period.
	1	Complexity value for tonight period.
	3	Complexity value for tomorrow period.

Precipitation Control Constants

Constant	Value	Description
LP1	20	If the 12-h POP is greater than or equal to LP1, precip will be mentioned. (See LP5)
LP2	25	If the 12-h POP is greater than or equal to LP1 and less than LP2, the qualifier will be "slight chance of."
LP3	55	If the 12-h POP is greater than or equal to LP2 and less than LP3, the qualifier will be "chance of."
LP4	75	If the 12-h POP is greater than or equal to LP3 and less than LP4, the qualifier will be "likely." If the 12-h POP is greater than or equal to LP4, no qualifier will be used.
LP5	10	If the TSTM is greater than or equal to LP5, precip will be mentioned even if the 12-h POP is less than LP1, provided the 12-h POP is greater than or equal to 10.
LP6	80	If POF is greater than or equal to LP6, the forecast will be "snow" rather than "wet snow."
LP7	65	If POF is greater than LP7, snow is indicated.
LP8	50	The breakpoint to emphasize snow over rain.
LP9	35	If POF is less than LP9, liquid precip is indicated.
LP10	40	"Drizzle" will not be used unless the DRZL is greater than or equal to LP10 and the 12-h POP is greater than or equal to LP10. To negate this effect set LP10 = 0.
LP11	5	The constant controlling the amount by which the 12-h POP's are smoothed before use. This is not rounding. For instance, if the absolute value of the difference between all 3 pairs of POP's is less than or equal to LP11, all 3 POP's are set equal to the average.
LP12	27	If the current surface temperature is less than LP12 and it is the first period, freezing rain or sleet may be mentioned.
LP13	25	If the forecast min temperature is less than LP13 and it is the second period, freezing rain or sleet may be mentioned.

Precipitation Control Constants (cont'd)

Constant	Value	Description
LP14	34	If the forecast max temperature for tomorrow is less than LP14 and it is the third period, freezing rain or sleet may be mentioned.
LP15	34	If the forecast max temperature for today is less than LP15, if it is the first period, and if the precip is limited to the afternoon, sleet or freezing rain may be mentioned.
LP16	10	If the TSTM is greater than LP16, thunderstorms may be mentioned.
LP17	10	If the first 6-h POP is less than LP17 and the second 6-h POP minus the first 6-h POP is greater than LP18, precip may be limited to the last part of the period. Also if the second 6-h POP is less than LP17 and the first 6-h POP minus the second 6-h POP is greater than LP18, the precip may be limited to the first part of the period.
LP18	25	See LP17.
LP19	10	If the period precip complexity is 1, if the period is the first, if the 12-h POP is less than LP1, if the TSTM is greater than LP5, and if the first 6-h POP minus the second 6-h POP is greater than or equal to LP19, the precip is limited to the morning. There is also a similar arrangement for the afternoon.
LP20	5	If the POF is less than LP20 the phrase at the end will be "Probability of rain ..." If the POF is greater than 100-LP20, the phrase will be "Probability of snow ..." Otherwise the phrase will be "Probability of precipitation ..."
LP21	35	If the 12-h POP is less than LP21, precip will not be emphasized.
LP22	2	If the QPF category is greater than or equal to LP22, "heavy at times" will be used in the precip phrase.
LP23	55	If the 12-h POP is greater than LP23, clouds will not be mentioned unless precip is indicated in only part of the period.
IP	1	Complexity value for the first period.
	1	Complexity value for the second period.
	2	Complexity value for the third period.

Appendix III
Cloud Phrase Selection

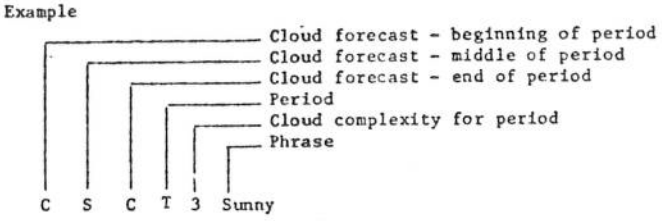
Cloud forecasts

C - clear
S - scattered
B - broken
O - overcast

Forecast Period

D - today
N - tonight
T - tomorrow

Example



C	C	C	D	1	CLEAR
C	C	C	D	2	CLEAR
C	C	C	D	3	CLEAR
C	C	C	N	1	CLEAR
